WATER TREATMENT

Characteristics

Presentation	: Light Yellow Liquid
Nature	: Quaternary Ammonium
PH 10 g./L	: 7.5 ± 0.3
Density at 20°C	: 0.99 g/cm ³ .

Description and Applications

It is a liquid concentrate that is used for the treatment of irrigation pond water, preventing the proliferation of algae and pathogens. Due to its formulation, it is capable of eliminating bad odors produced by putrefaction. It has great advantages over the use of copper sulfate, since it is non-toxic and does not attack the mechanisms of irrigation systems, it also has a great dissolution capacity that makes it easier to use. It is compatible with ammonia derivatives, hypochlorites, nonionic and cationic surfactants and most inorganic acids and bases.

How to use

Dilute the product to a concentration of 5 liters 1000 m³ of water. It is recommended to spray from the banks of the pond with a spray lance to spread the product inwards and achieve maximum dispersion and homogenization over the volume of water to be treated. It can cause foam due to agitation at the time of casting that will disappear after a few minutes.

Presentation

Polypropylene container of 25, 220 or 1000 Lts.

For more information, read our safety data sheet.
